Delos-NSF Workshop: June 18-20, 2001

A Working Definition

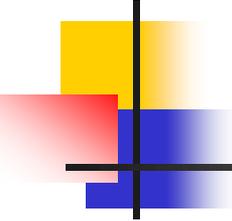

- $\text{Outcome}(t) = f(\text{Action}(t), \text{PersonalHistory}(t-n))$
- Examples,
 - Relevance feedback
 - Content-based filtering
 - Collaborative filtering
 - Caching, history lists, auto completion, MRU
 - Implicit queries, Rememberance Agent, Watson, Kenjin
 - MyYahoo!, MyAOL, MyMSN, MyLibrary, etc.
 - AltaVista's MySearch, iLOR
- ...

A Demonstration: What do you see?

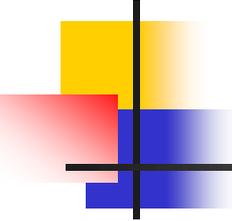

June 18, 2001

Delos-NSF Workshop

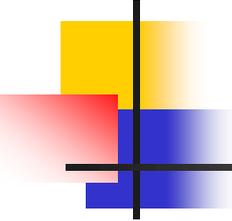

Many Kinds of Individual Differences

- Task – “info need”
 - Short-term, relevance feedback
 - Long-term, content-based filtering
- Preferences, e.g., CF
- Expertise, domain and application
- Cognitive aptitudes
 - Verbal, spatial, reasoning skills, etc.
- Demographics
 - Age, major, gender, location, etc.
- Cognitive styles, personality and affect

Individual Differences Are ...

- Large
- Systematic
- Systems can often be modified to accommodate
 - E.g., robust systems
 - E.g., personalization

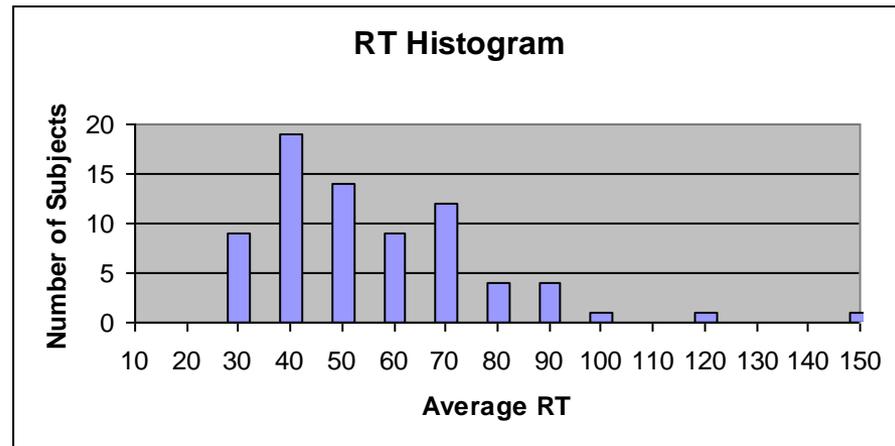

How Big Are Individual Diffs?

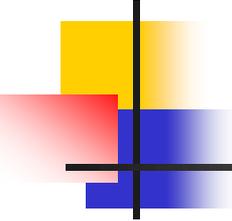

- E.g., Web searching (Chen & Dumais, CHI 2000)
 - 74 participants; Intermediate web/search experience
 - 30 search tasks (e.g., *Home page for "Seattle Weekly"*)
 - Average RT (seconds) = 52.3 seconds
- Individual subjects' average RT:
 - 69, 30, 76, 48, 29, 68, 69, 49, 75, 62, 64, 69, 26, 89, 50, 44, 54, 35, 39, 30, 71, 56, 28, 59, 36, 67, 93, 37, 39, 49, 28, 89, 37, 36, 31, 47, 66, 62, 51, 30, 40, 38, 31, 70, 37, 36, 36, 88, 41, 50, 84, 68, 42, 58, 34, 25, 23, 22, 41, 62, 35, 41, 41, 60, 36, 56, 78, 144, 43, 58, 58, 45, 38, 115

Characterizing Individ Diff

- Histogram

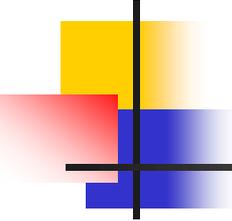

- Max:Min 144, 22 = 6.5:1
- Q3:Q1 66, 36 = 1.8:1
- SD/X .42

Example Individual Diffs

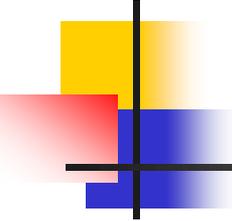

Example Individual Differences

Task	Max/Min	Q3/Q1	SD/X
Grocery Cashiers	2:1	1.5:1	
Text Editing	5:1	2:1	0.4
Information Retrieval	8:1	2.5:1	0.6
Computer Programming	20:1	3:1	0.8

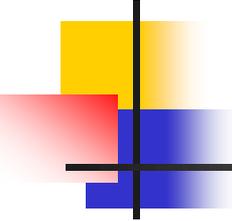

Individual Diffs Correlated w/ Performance in HCI/IR Tasks

- Experience – both application and domain
- Reasoning (Egan et al.; Card et al.; Greene et al.)
- Spatial abilities (Egan & Gomez; Vicente et al.; Stanney & Salvendy; Allen)
- Academic major (Borgman)
- Verbal fluency (Dumais & Schmitt)
- Reading comprehension (Greene et al.)
- Vocabulary (Vicente et al.)
- Age (Egan et al.; Greene et al.; Konvalina et al.)
- Personality and affect
- Gender

Framework for Identifying and Accommodating Individ Diff

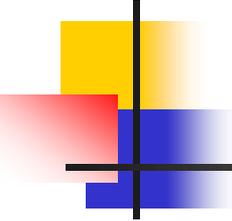

- **Assay** – which user characteristics predict differences in performance; many studies stop here
- **Isolate** – isolate the source of variation to a specific sub-task or design component
- **Accommodate** – do something about it
 - Often harder than you think ...
 - E.g., Spatial ability and hierarchy navigation
 - E.g., Expertise
 - Evaluate!!!

Greene et al. *No IFs, ANDs, or ORs: A Study of Database Querying*

- Task: *Find all employees who either work in the toy department or are managed by Grant, and also come from the city London.*
- SQL – fixed syntax, logical operators, parentheses
 - E.g.,

SELECT	Name
FROM	Employee
WHERE	(Department = Toy
OR	Manager = Grant)
AND	City = London
- TEBI – just need attribute names and values; recognize alternatives from system-generated table
 - E.g., Name, Department = Toy, Manager = Grant, City = London

Greene et al. (Assay)

- Assessed individual characteristics:
 - Age, spatial memory, reasoning, integrative processing, reading comprehension & vocabulary
- Found large effects of:
 - Integrative processing (on accuracy, for SQL interface)
 - Age (on time, for SQL interface)

Greene et al.

<percent correct x integrative processing>

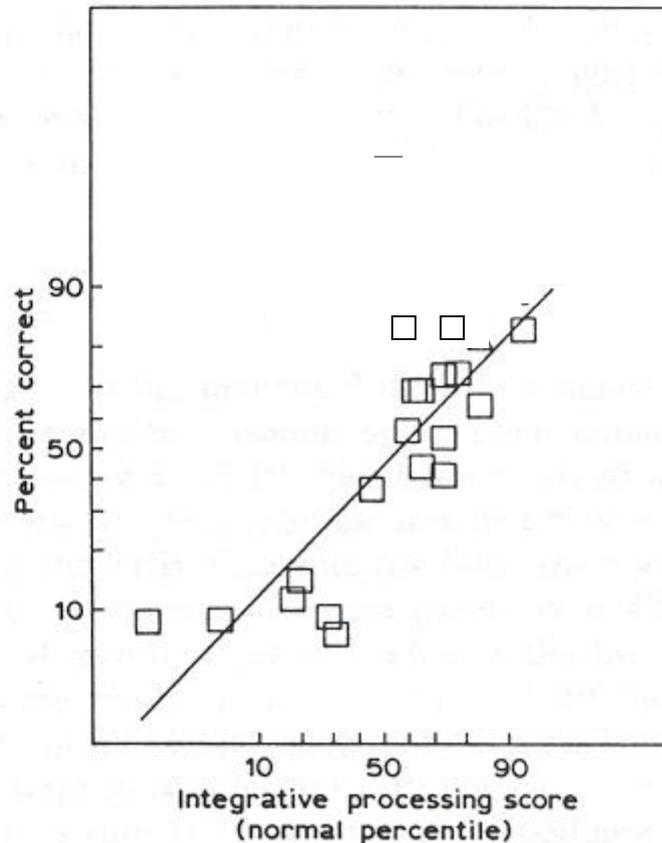

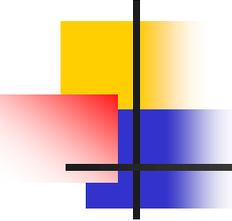

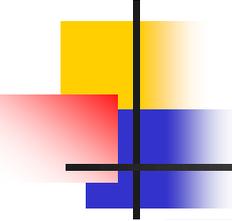

FIGURE 2. This modified partial residual plot shows percent correct as a function of integrative processing skill (a measure of reasoning ability), for two language conditions (TEBI Concrete and SQL Generation). The lines represent the predicted score holding the other individual difference variables at their means. The points represent individual subjects' scores minus the contribution of the other individual difference variables. The slopes of the lines indicate the importance of integrative processing to prediction of performance in the two language conditions. The difference between the points and the line is an indication of goodness of fit. Δ , TEBI; \square , SQL.

"AND + OR" queries

Greene et al. (Isolate)

- Examined two possible sources of difficulties
 - Interpreting the query
 - Specifying the query in a formal notation or query language

Example TEBI Table

<u>Employee</u>			
Name	Department	Manager	City
Jones	Toy	Grant	London
Allan	Toy	Grant	Athens
Doe	Toy	Buford	London
Smith	Toy	Buford	Athens
Price	Cosmetics	Grant	London
Hall	Cosmetics	Grant	Athens
Kelso	Cosmetics	Buford	London
Lee	Cosmetics	Buford	Athens

Greene et al.

<percent correct x integrative processing>

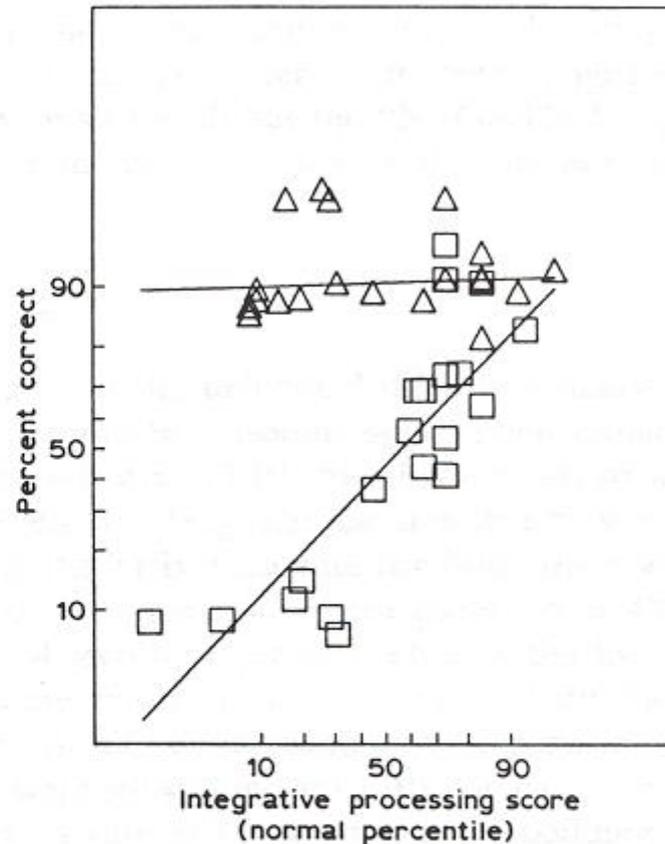

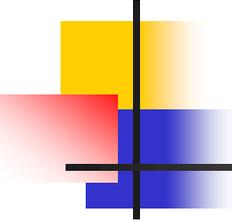

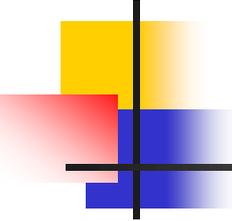

FIGURE 2. This modified partial residual plot shows percent correct as a function of integrative processing skill (a measure of reasoning ability), for two language conditions (TEBI Concrete and SQL Generation). The lines represent the predicted score holding the other individual difference variables at their means. The points represent individual subjects' scores minus the contribution of the other individual difference variables. The slopes of the lines indicate the importance of integrative processing to prediction of performance in the two language conditions. The difference between the points and the line is an indication of goodness of fit. Δ , TEBI; \square , SQL.

"AND+OR" queries

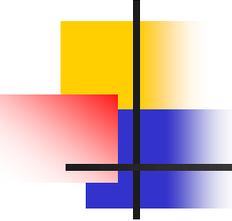

Greene et al. (Accommodate)

- SQL – hard, especially for some users
- TEBI – new query specification language
 - Improved performance overall
 - Reduced many dependencies on reasoning skills and age
 - “Robust interface”

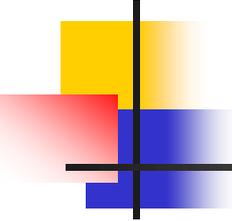

How to Accommodate?

- Robust interfaces: A new design improves the performance for all
 - E.g., Greene et al.'s *TEBI* interface
 - E.g., Dumais & Schmitt's *LikeThese* interface
- Training:
- Personalization: Different interfaces/systems for different people
 - Group level - E.g., Grundy prototypes, I3R stereotypes, Expert/Novice
 - Individual level
 - Task (Info Need) level

Personalization Framework

- Characteristics for personalization
 - Expertise, Task, Preferences, Cog Aptitudes, Demographics, Cog Styles, Etc.
- Assay: How specified/modeled?
 - Implicit, Explicit, Interaction
 - Stability over time?
 - Long-term, short-term
- Accommodate: What to do about it?
 - Many ways of accommodating
 - Evaluation
 - Benefits of correct assessment and accommodation
 - Costs of mis-assessment

Content-Based Filtering

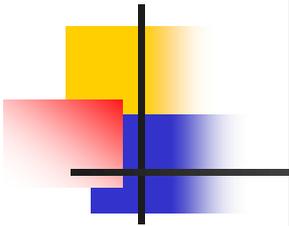

Match new content to standing info need

- **Assay:**

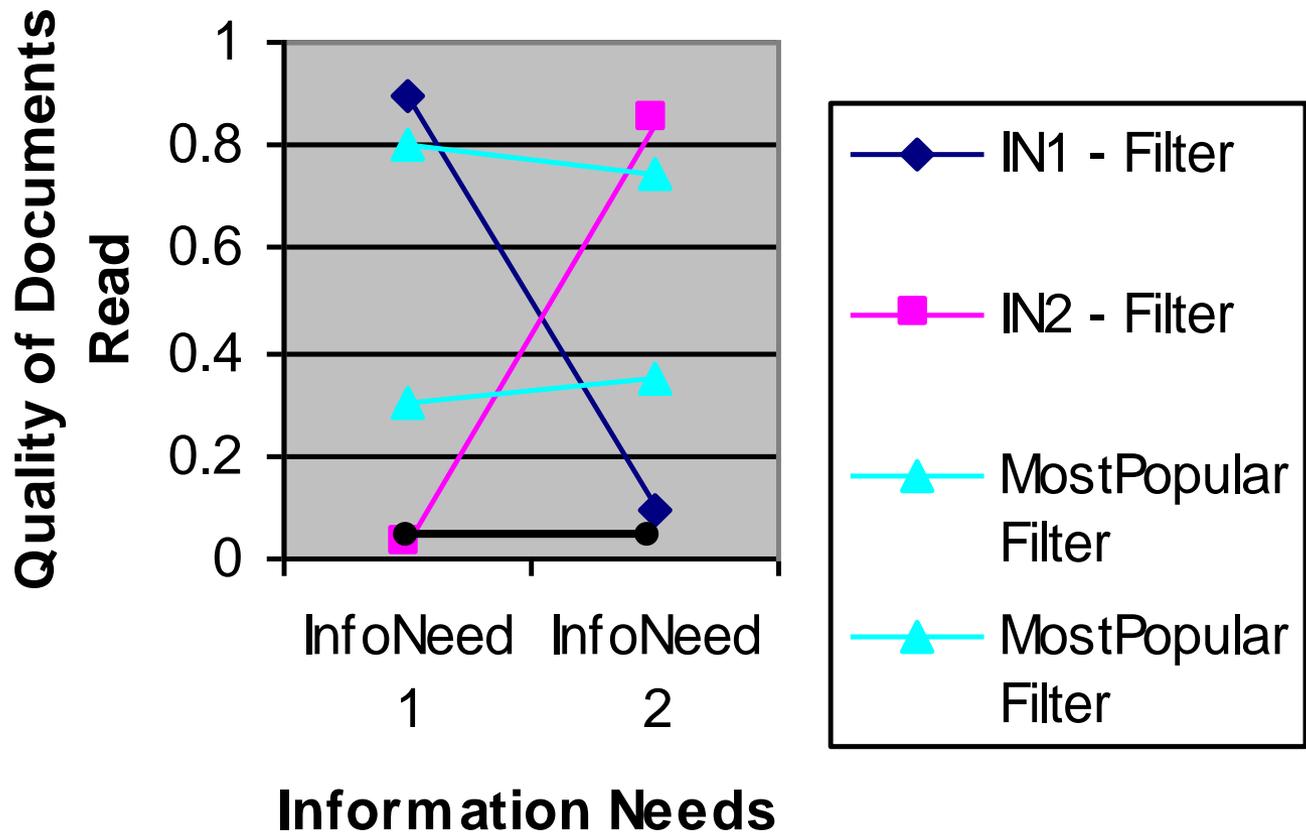

- Explicit or Implicit profile specification?
 - Ongoing feedback?
- How rapidly does profile it change?

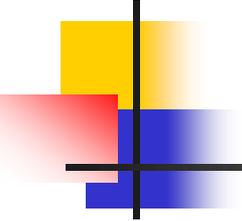

- **Accommodate:**

- Match profile against stream of new docs
 - Reduce number of docs to view
 - Return more relevant docs
- Benefits/Costs

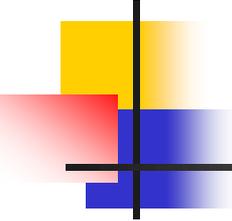

Information Filtering

ASI Examples

- Collaborative Filtering
- Implicit/Background Query
- Lumiere
- Temporal Query Patterns

Example: *MSRweb Recommender*

<Breese, Heckerman, Kadie, UAI'98>

- Collaborative filtering algorithms
 - Bayesian network
 - Correlation+
 - Vector similarity
 - Bayesian clustering
 - Popularity
- Test collections
 - Each Movie
 - Nielsen
 - Microsoft.com
- Predicted
 - Individual scores
 - Ranked score

Example: *MSRweb Recommender*

Adaptive Systems & Interaction

Overview

The Adaptive Systems & Interaction group (ASI) pursues research on automated reasoning, adaptation, and human-computer interaction. Interests of the group include principles and applications of decision making and learning, computation in the face of complexity, techniques for information management and search, and the development and evaluation of innovative designs for visualization and interaction.

Research goals include both the pursuit of basic science and the development of computing and communications applications that demonstrate new functionalities and flexibility. ASI is at the center of user modeling at Microsoft Research, focused on inferring the goals and needs of users from multiple sources of information about activity and interests.

The group is also home to research on information retrieval and management, including work in automated text classification and clustering. The ASI team continually attempts to identify new means for enriching the user experience through advances in automated reasoning and user interface design.

Areas of focus:

User Modeling and Intelligent User Interfaces. We pursue methods for enhancing human-

When do you want to go “where everybody knows your name” (and mailing address, and preferences, and last 50 web pages visited)?: A framework for personalization

Susan T. Dumais
Adaptive Systems and Interaction Group
Microsoft Research
Redmond, WA 98033 USA
sdumais@microsoft.com

Abstract

Over the years, I have been involved in developing several information personalization prototypes (e.g., content-based filtering, collaborative filtering, implicit queries and visualization). Sometimes personalization works pretty well, and other times it never catches on or participation falls off after an initial spurt of interest. I think it is instructive to reflect on an even wider range of personalization efforts to begin to develop a framework (or at least articulate a set of considerations) for better understanding and developing personalized digital library services.

As a working definition, I consider a personalized system to be one that responds differently to two people who issue the same proximal request, depending on their previous history of interaction with the system. Examples of such systems include content-based and collaborative filtering as well as caching, history lists, dynamic menus, automatic completion, customized content selection, and implicit queries. These systems vary in many respects – e.g., the characteristics that are used for personalization (e.g.,

Editorial Reviews
From Kirkus Reviews

What dire secret could make Lainie Smith, Seattle's well-heeled answer to Mother Teresa, vulnerable to blackmail? Whatever it is, it's something she's been paying \$2,000 a week to keep quiet--and something she doesn't want to share with her lawyer, Kathy Birchfield, or Kathy's husband, private eye Thomas Black (*The Million-Dollar Tattoo*, 1996, etc.). Thomas doesn't insist on knowing Lainie's secret, but as he gets deeper into the case--trailing the two men who pick up the latest two grand, searching the lair he's tracked one of them to, dispensing his trademark similes (one craven suspect has "an alibi prepared like a frozen dinner in the freezer")--he can hardly help finding out what it is. And it's dynamite, something it's no wonder Lainie didn't want him to know: Seventeen years ago she was present with recently executed Charlie Groth when four

Personalization Success

- Effectively Assay and Accommodate:
 - Easy to specify relevant information
 - Explicitly: profile changes slowly
 - Implicitly: capture automatically, esp short time
 - We know what to do about it
 - Algorithmic and application levels
 - And, the user can see the benefit
 - And, there are few big failures

Personalization Opportunities

- Geo-coding
- Query history
- Query plus usage context
- Keeping found things found

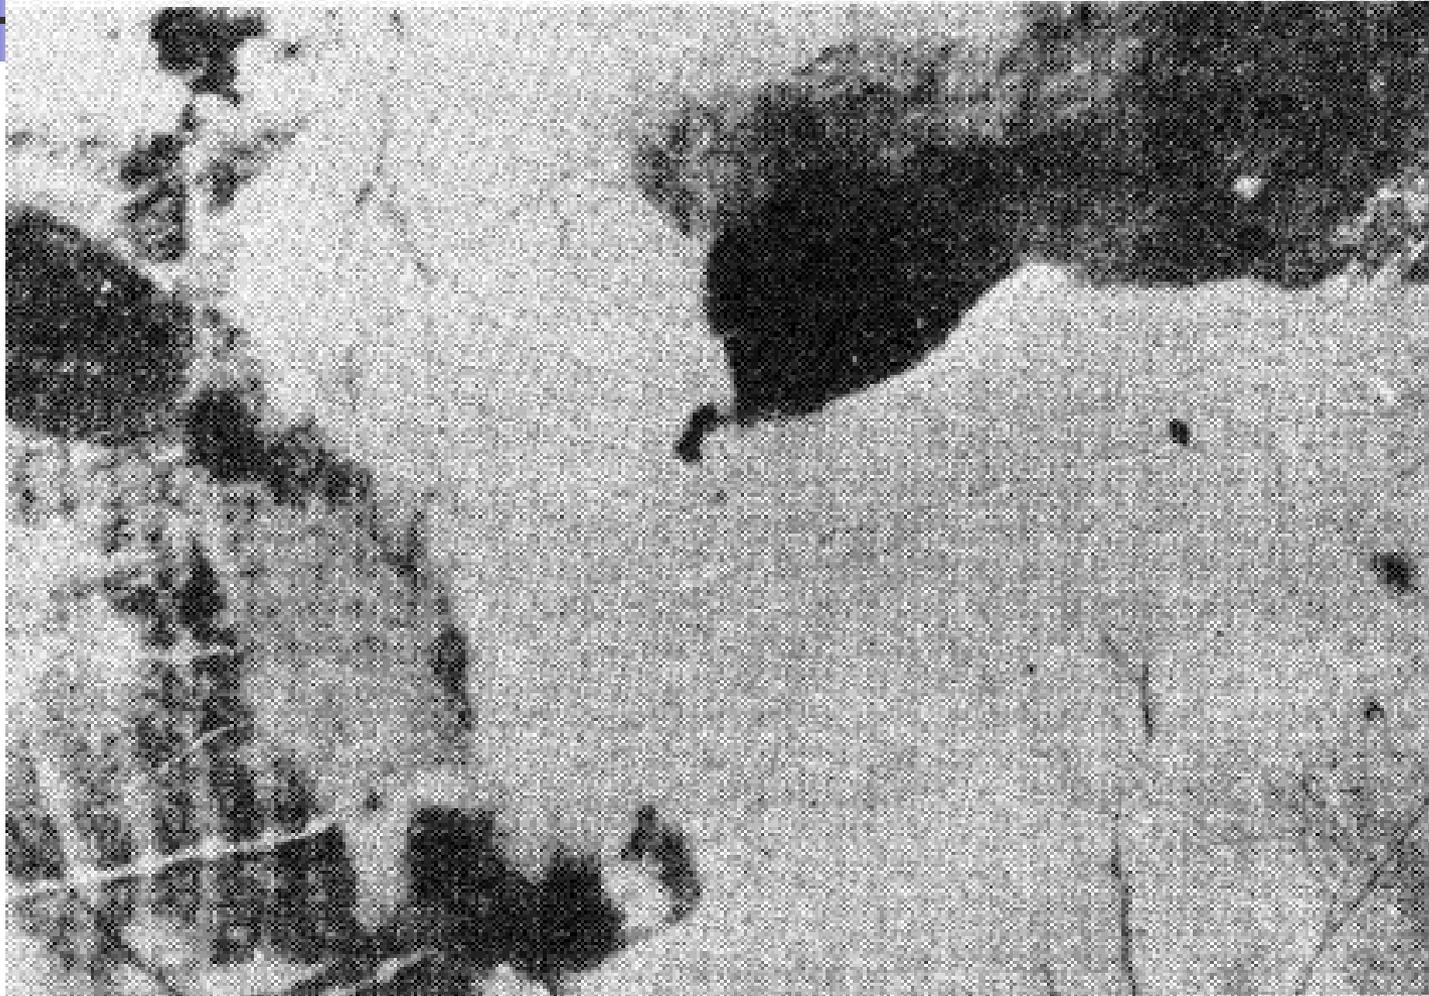

Open Issues

- Evaluation ... difficult for personalized systems
 - Components, easier
 - End-to-end applications, harder
 - Questionnaires
 - Pre-Post assessment
 - Algorithmic issues in situ
- Privacy, security ...

The End ...
