Using Context to Support Searchers

Web Info through the Years

What's available

■ Number of pages indexed

- 7/94 Lycos -
- 95 - 10^6 millions
- 97 - 10^7
- 98 - 10^8
- 01 - 10^9 billions
- 05 - 10^{10} ...

■ Types of content

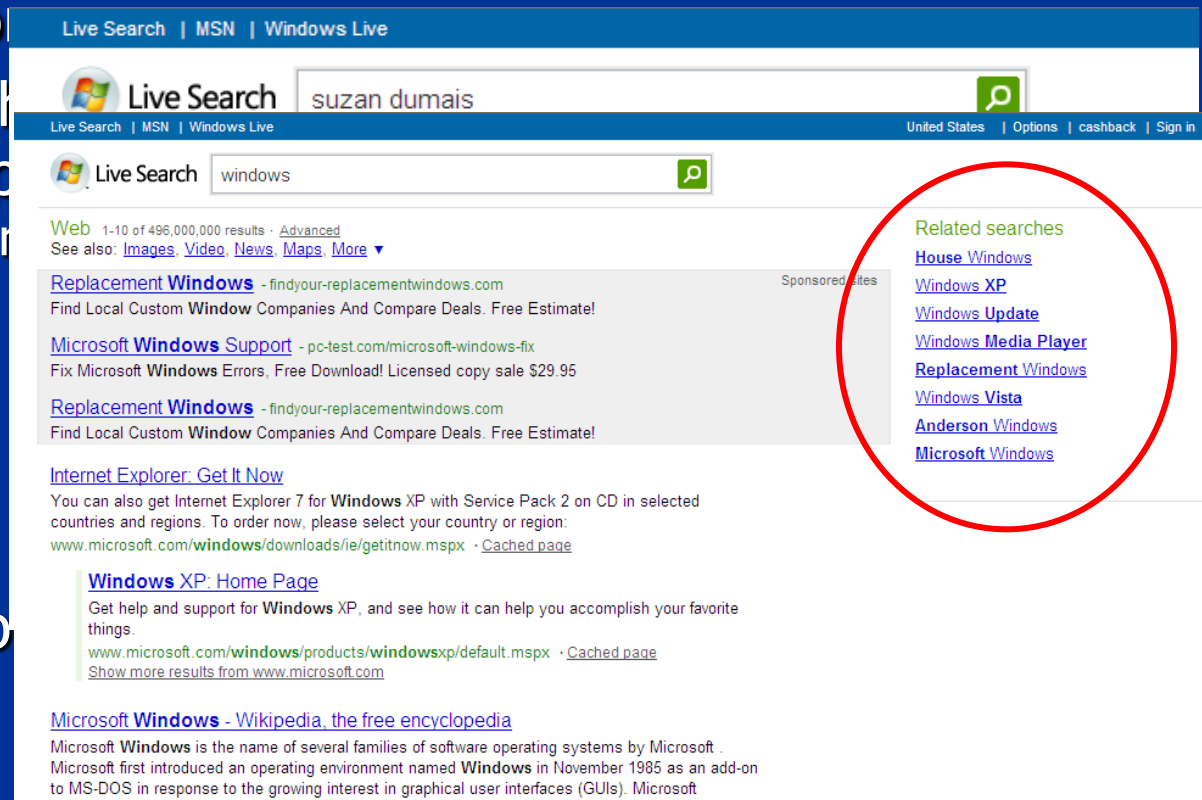

- Web pages, newsgroups
- Images, videos, maps
- News, blogs, spaces
- Shopping, local, desktop
- Books, papers
- Health, finance, travel ...

How it's accessed

Some Support for Searchers

- The search box
- Spelling suggestions
- Query suggestion
- Advanced search operators and operators (e.g., “”, +/-, site:, filetype:, intitle:)
- Richer snippets
- But, we can do better using context

Key Contexts

■ Users:

- Individual, group (topic, time, location, etc.)
- Short-term or long-term models
- Explicit or implicit capture

■ Documents/Domains:

- Document-level metadata, usage/change patterns
- Relations among documents

■ Tasks/Uses:

- Information goal - Navigational, fact-finding, informational, monitoring, research, learning, social, etc.
- Physical setting - Device, location, time, etc.

Using Contexts

- Identify:
 - What context(s) are of interest?
- Accommodate:
 - What do we do differently for different contexts?
 - Outcome (Q|context) >> Outcome (Q)
- Influence points within the search process
 - Articulating the information need
 - Initial query, subsequent interaction/dialog
 - Selecting and/or ranking content
 - Presenting results
 - Using and sharing results

Context in Action

Research prototypes: provide insights about algorithmic, user experience, and policy challenges

■ User Contexts:

- Finding and Re-Finding (Stuff I've Seen)
- Personalized Search (PSearch)
- Novelty in News (NewsJunkie)

■ Document/Domain Contexts:

- Metadata and search (Phlat)
- Visualizing patterns in results (GridViz)

■ Task/Use Contexts:

- Pages as context (Community Bar, IQ)
- Richer collections as context (NewsJunkie, PSearch)
- Working, understanding, sharing (SearchTogether, InkSeine)

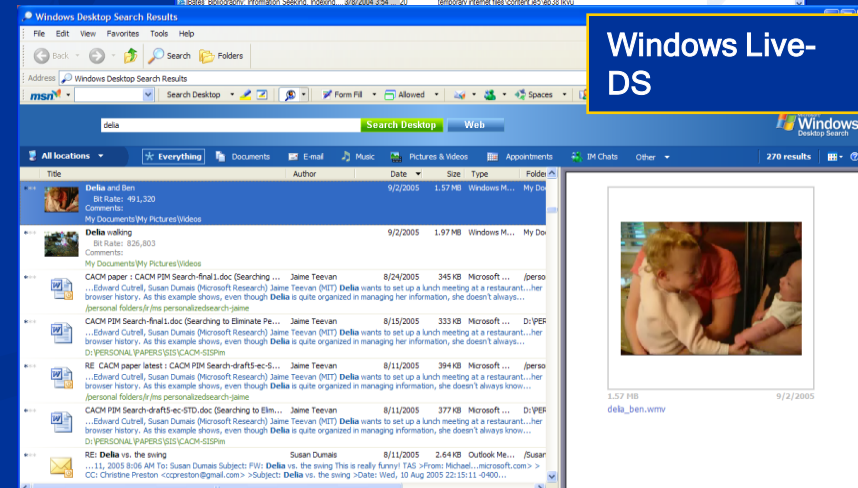

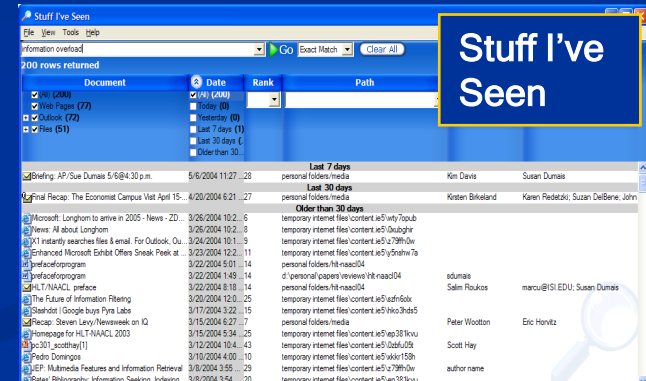

S/S: Stuff I've Seen

■ Unified index of *stuff you've seen*

- Many info silos (e.g., files, email, calendar, contacts, web pages, rss, im)
- Unified index, not storage
- Index of content and metadata (e.g., time, author, title, size, access)
- Re-finding vs. finding

➔ *Vista Desktop Search*
(and Live Toolbar)

Also, Spotlight, GDS, X1, ...

SIS Demo

Stuff I've Seen

SIS Usage Experiences

Internal deployment

- ~3000 internal Microsoft users
- Analyzed: Free-form feedback, Questionnaires, Structured interviews, Log analysis (characteristics of interaction), UI expts, Lab expts

Personal store characteristics

- 5k - 500k items

Query characteristics

- Short queries (1.6 words)
- Few advanced operators or fielded search in query box (~7%)
- Many advanced operators and query iteration in UI (48%)
 - Filters (type, date); modify query; re-sort results

Susan's (Laptop) World		
Type	N	Size
Web	3k	0.2 Gb
Files	28k	23.0 GB
Mail	60k	2.2 Gb
Total	91k items	25.4 Gb
Index		190 Mb
		+1.5 Mb/week

SIS Usage Data, cont'd

Importance of people, time, and memory

■ People

- 25% of queries contained names
- People in roles (to:, from:) vs. people as entities in text

■ Time

- Age of items opened
 - 5% today; 21% last week
 - 50% of the cases in 36 days
Web (11); Mail (36); Files (55)
- **Date** most common sort field, even when Rank was the default
 - Support for episodic memory

■ Few searches for “best” topical match ... many other criteria

$$\text{Log(Freq)} = -0.68 * \text{log(DaysSinceSeen)} + 2.0$$

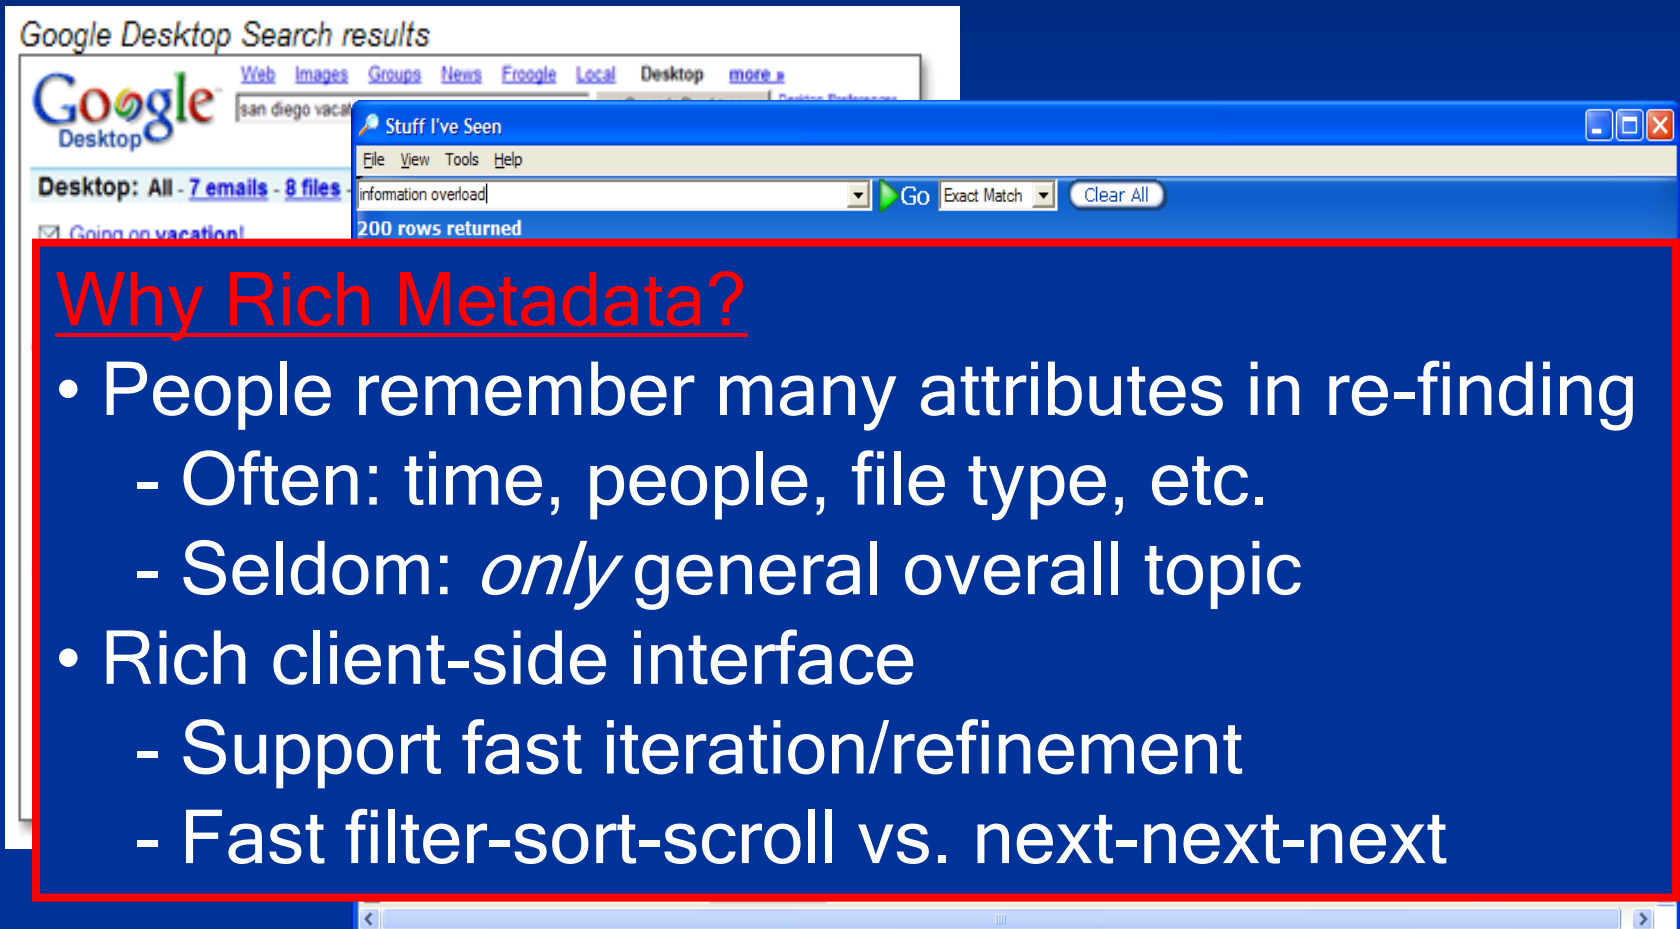

SIS Usage Data, cont'd

Observations about unified access

- Metadata quality is variable
 - Email: rich, pretty clean
 - Web: little, available to application
 - Files: some, but often wrong
- Memory depends on abstractions
 - “Useful date” is dependent on the object !
 - Appointment, when it happens
 - File, when it is changed
 - Email and Web, when it is seen
 - “People” attribute vs. contains
 - To, From, Cc, Attendee, Author, Artist

Ranked list vs. Metadata (for personal content)

A screenshot of the Google Desktop Search interface. The top window shows 'Google Desktop Search results' with the Google logo and navigation links for Web, Images, Groups, News, Froogle, Local, Desktop, and more. Below the logo, it says 'Desktop: All - 7 emails - 8 files' and 'Going on vacation!'. A search bar contains the text 'information overload' and a 'Go' button. To the right of the search bar are 'Exact Match' and 'Clear All' buttons. Below the search bar, it says '200 rows returned'. A second window titled 'Stuff I've Seen' is overlaid on the first, showing a menu with 'File', 'View', 'Tools', and 'Help'.

Why Rich Metadata?

- People remember many attributes in re-finding
 - Often: time, people, file type, etc.
 - Seldom: *only* general overall topic
- Rich client-side interface
 - Support fast iteration/refinement
 - Fast filter-sort-scroll vs. next-next-next

Re-finding on the Web

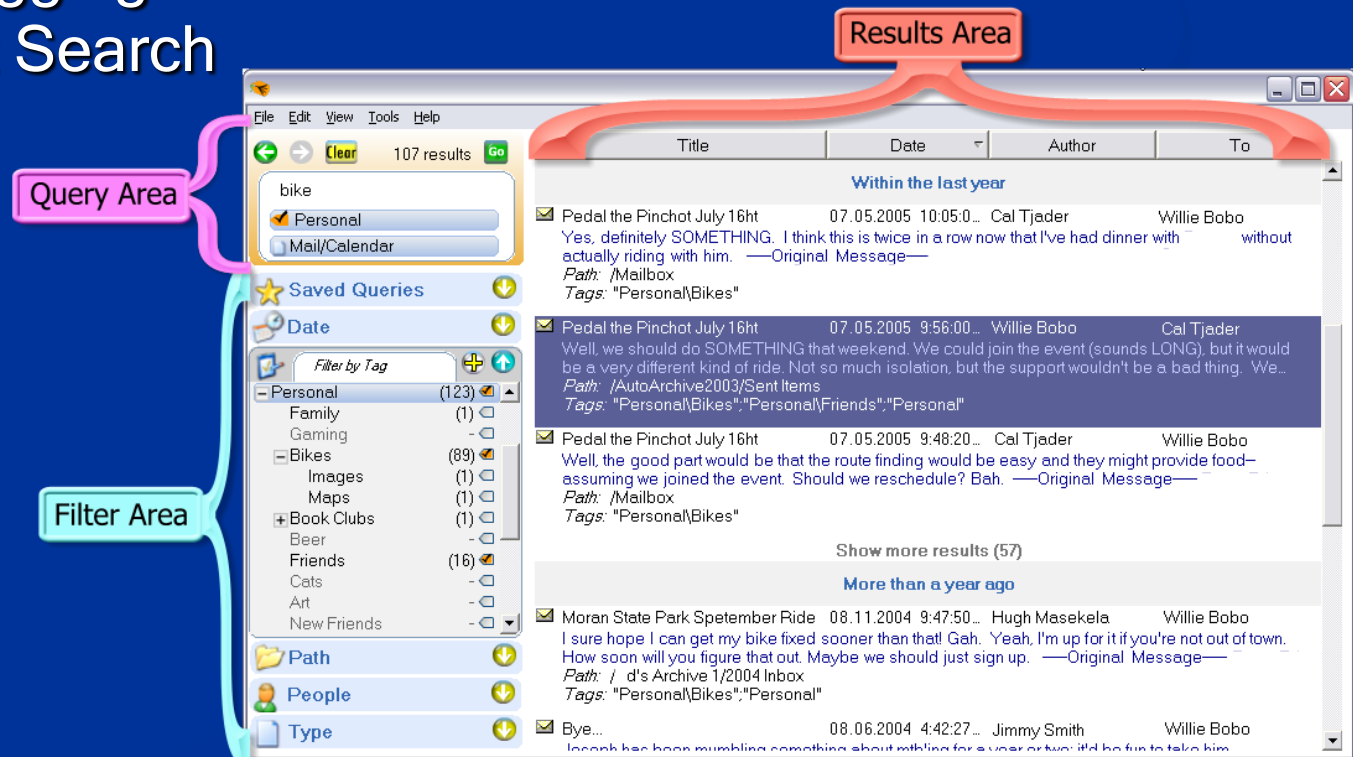

- 50-80% URL visits are revisits
- 30-40% of queries are re-finding queries

Table 1. A classification of different query types.

All queries: 13,060 queries (100%)	Overlapping Click Queries – 5072 queries (39%)			No Common Clicks 7988 (61%)
	Equal Click Queries – 3777 (29%)		Some Common Clicks 1295 (10%)	
	Single Identical Click 3737 (29%)	Multiple Identical Clicks 40 (< 1%)		
Equal Query Queries 4256 (33%)	Navigational Queries 3100 (24%)	36 (< 1%)	635 (5%)	485 (4%)
Different Query 8804 (67%)	637 (5%)	4 (< 1%)	660 (5%)	7503 (57%)

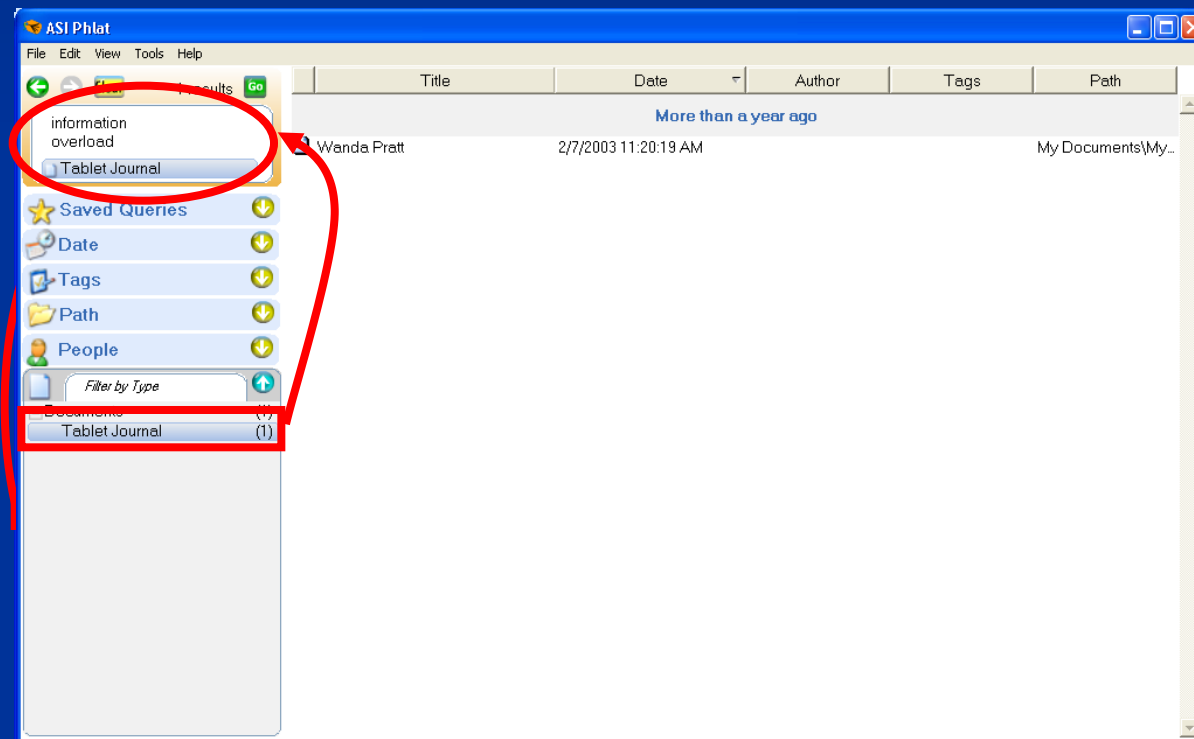

Phlat: Search and Metadata

- Shell for WDS; publically available
- Features:
 - Search / Browse (faceted metadata)
 - Unified Tagging
 - In-Context Search

Phlat: Faceted metadata

- Tight coupling of search and browse
- Q → Results &
 - Associated metadata w/ query previews
 - 5 default properties to filter on (extensible)
 - Includes tags
- Property filters integrated with query
 - Query = words and/or properties
 - No stuck filters
- Search == Browse

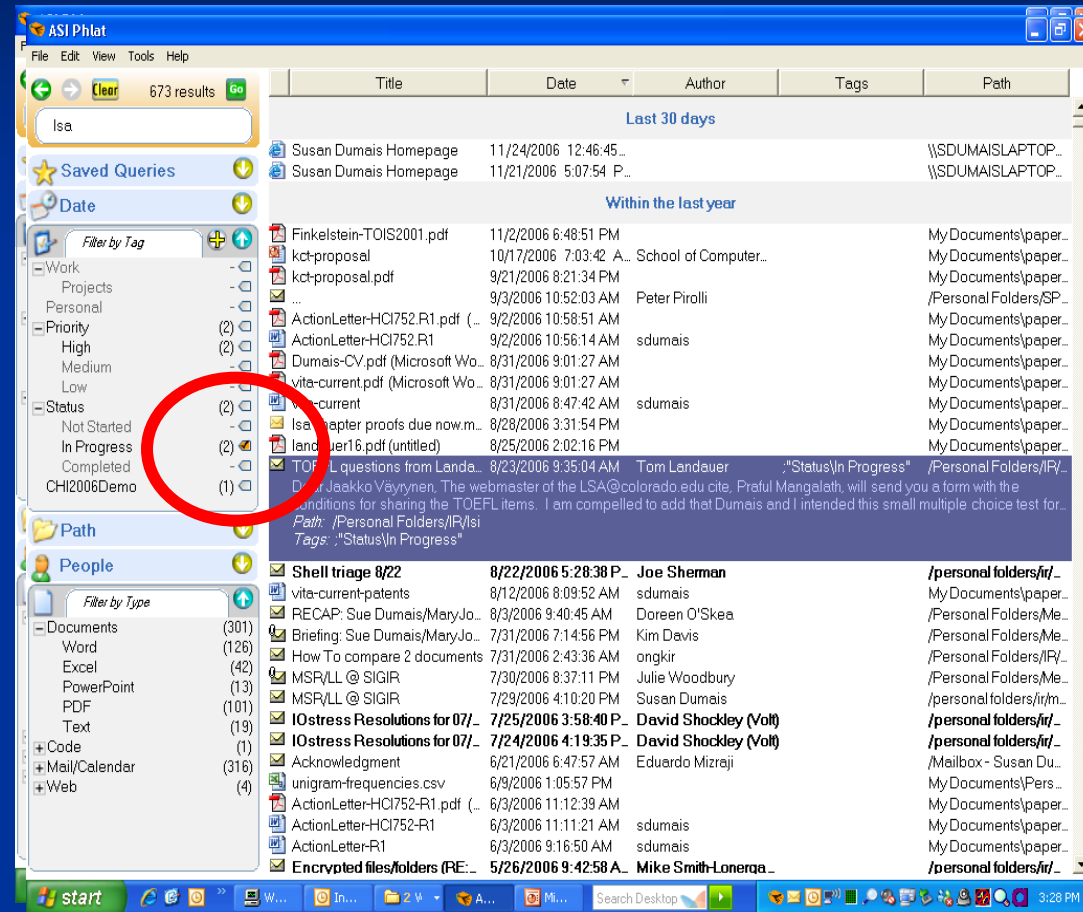

Phlat: Tagging

- Apply a **single set** of user-generated tags to **all content** (e.g., files, email, web, rss, etc.)
- Tagging interaction
 - Tag widget or drag-to-tag
- Tag structure
 - *Allow* but do not *require* hierarchy
- Tag implementation
 - Tags directly associated with files as NTFS or MAPI properties

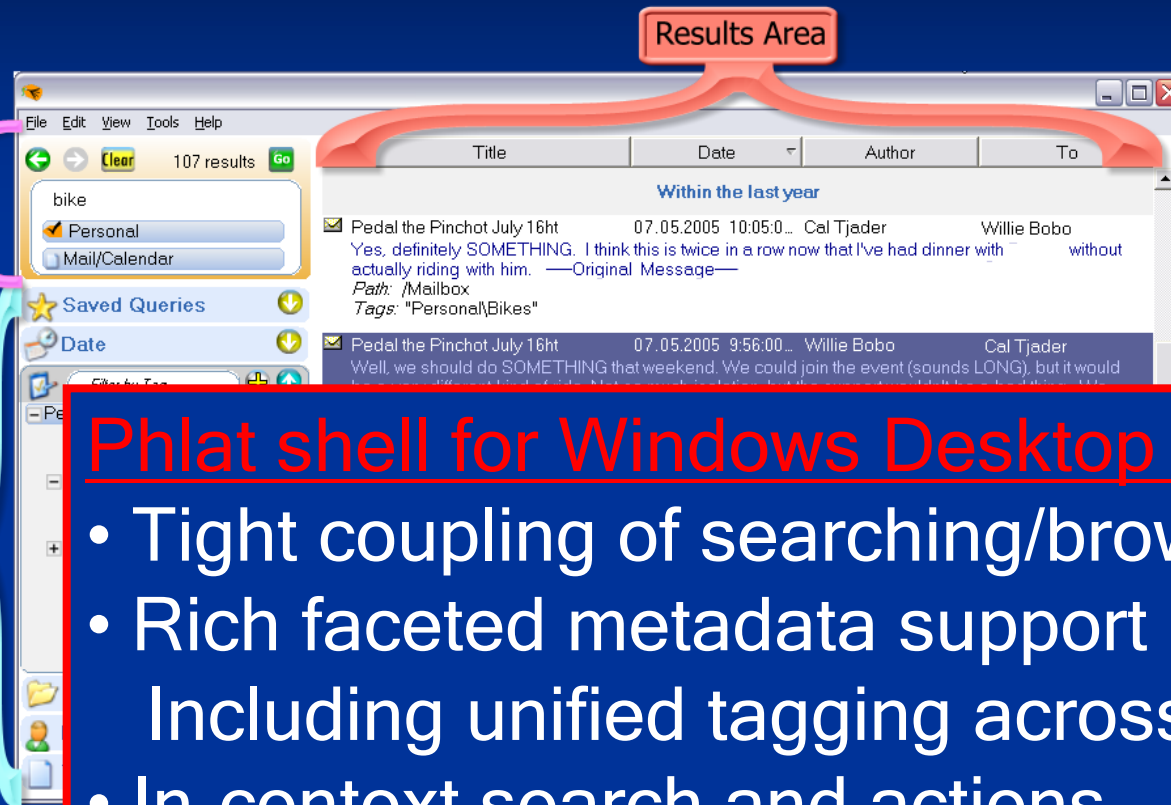

Phat: In-Context Search

- Selecting a result ...
- Linked view to show associated tags
- Rich actions
 - Open, drag-drop, etc.
- Pivot on metadata
 - “Sideways search”
 - Refine or replace query

Phlat

Phlat shell for Windows Desktop Search

- Tight coupling of searching/browsing
- Rich faceted metadata support
 - Including unified tagging across data types
- In-context search and actions

Download: <http://research.microsoft.com/adapt/phlat>

Web Search using Metadata

Many queries include implicit metadata

portrait of barak obama

recent news about midwest floods

good painters near redmond

starbucks near me

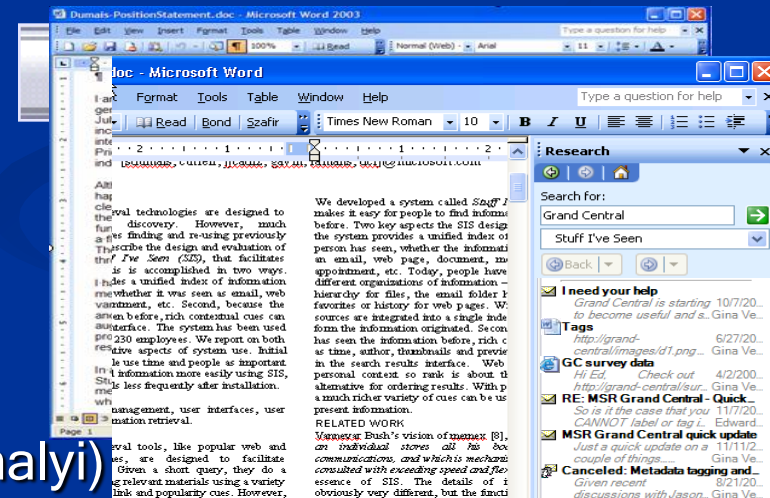

overview of high blood pressure

Limited support for users to articulate this

The screenshot shows the Food Network website's search results for the query 'cold soup'. The page features a green header with the Food Network logo and navigation tabs for Home, Recipes & Cooking, Holidays & Parties, Quick & Easy, Healthy Eating, TV, Shop, and Videos. A search bar at the top right contains the text 'cold soup'. Below the header, the search results are displayed, showing a list of recipes with their ingredients, prep times, and difficulty levels. On the left side, there is a sidebar with filters for 'Narrow Your Results By' and 'More Ingredients'. On the right side, there is an advertisement for Walmart and a section for 'In the Food Network Store'.

Search in Context

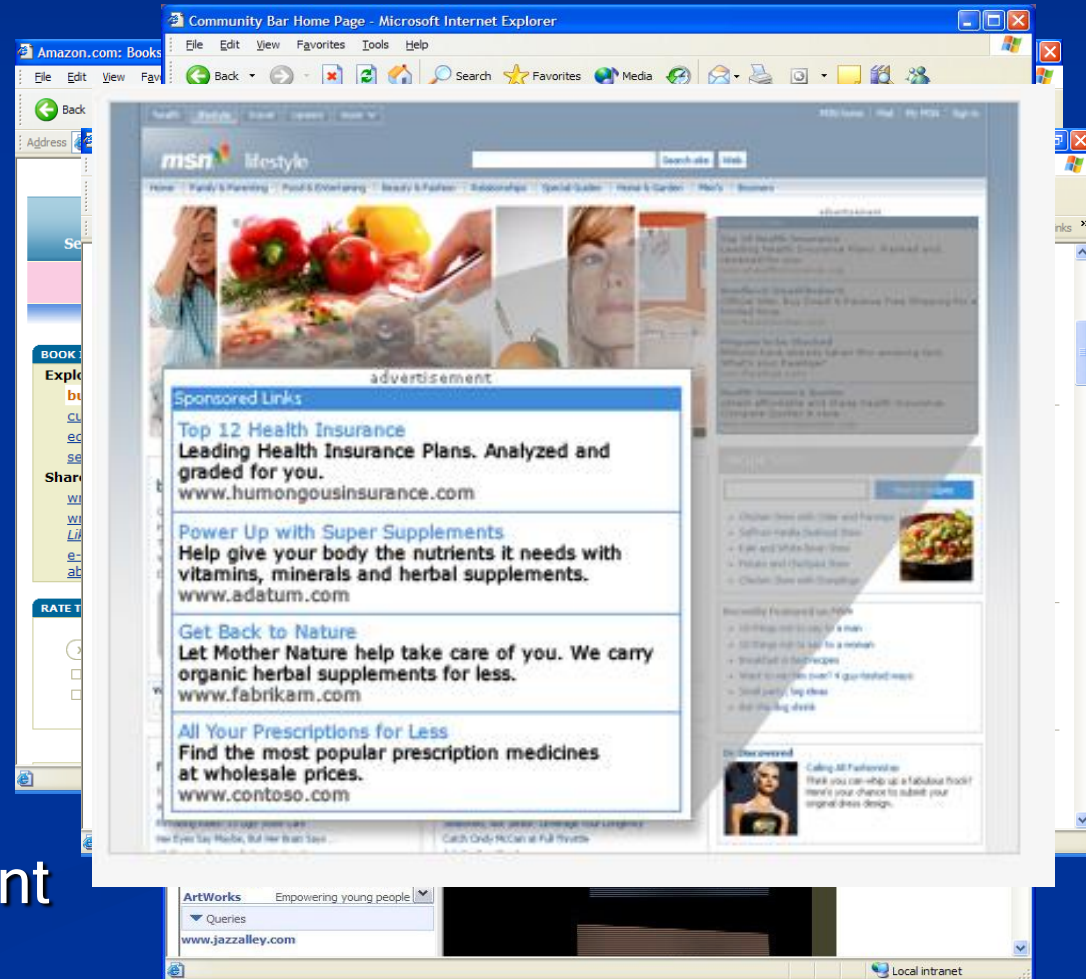

- Search is not the end goal ...
- Support information access in the context of ongoing activities (e.g., writing talk, finding out about, planning trip, buying, monitoring, etc.)
- Search always available
- Search from within apps (keywords, regions, full doc)
- Show results within app
- Maintains “flow” (Csikszentmihalyi)
- Can improve relevance

Documents as (a simple) Context

Proactive “query” specification depending on current document content and activities

- Recommendations
 - People who bought this also bought ...
- Contextual Ads
 - Ads relevant to page
- Community Bar
 - Notes, Chat, Tags, Inlinks, Queries
- Implicit Queries (IQ)
 - Also Y!Q, Watson, Rememberance Agent

Document Contexts (Implicit Query, IQ)

- Proactively find info related to item being read/created

- Quick links
- Related content

Challenges

- Relevance, fine
- When to show? (useful)
- How to show? (peripheral awareness)

The screenshot shows an email window titled "I need your help - Message (H)" with a toolbar and a message body. The message is from Gina Venolia to ASI and Affiliates, dated Tue 10/7/2003 10:08 AM. The subject is "I need your help". The body text discusses "Grand Central" and includes a link to <http://grand-central/install.html>. A "Hide IQ Window" button is visible on the left. To the right, an "IQPane" window is open, showing a search for "Gina Venolia" and "ASI and Affiliates" with a link to "I need your help".

Quick links for People and Subject.

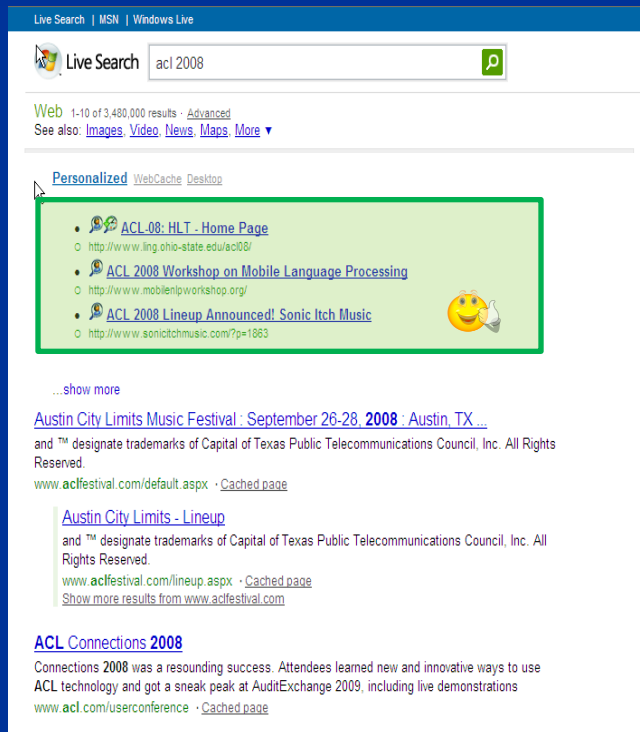

Background search on top k terms, based on user's index —

$$\text{Score} = \text{tf}_{\text{doc}} / \log(\text{tf}_{\text{corpus}} + 1)$$

Top matches for this Implicit Query (IQ).

*P*Search: Personalized Search (Even Richer Context)

- Today: People get the same results, independent of current session, previous search history, etc.
- PSearch: Uses rich client-side info to personalize results

- Building a user profile

- Personalized ranking

- When to personalize?

- How to personalize display?

ACM SIGIR Special Interest Group on Information Retrieval Home Page

Welcome to the ACM SIGIR Web site ... SIGIR thanks Doug Oard, Bill Hersh, David Carmel, Noriko Kando, Diane Kelly... Get ready for SIGIR 2008!

sigir.org

Building a User Profile

PSearch

- Type of information:
 - Explicit: Judgments, categories
 - Content: Past queries, web pages, desktop
 - Behavior: Visited pages, dwell time
- Time frame: Short term, long term
- Who: Individual, group
- Where the profile resides:
 - Local: Richer profile, improved privacy
 - Server: Richer communities, portability

Personalized Ranking

■ Personal Rank = $f(\text{Cont}, \text{Beh}, \text{Web})$

■ Pers_Content Match: $\text{sim}(\text{result}, \text{user_content_profile})$

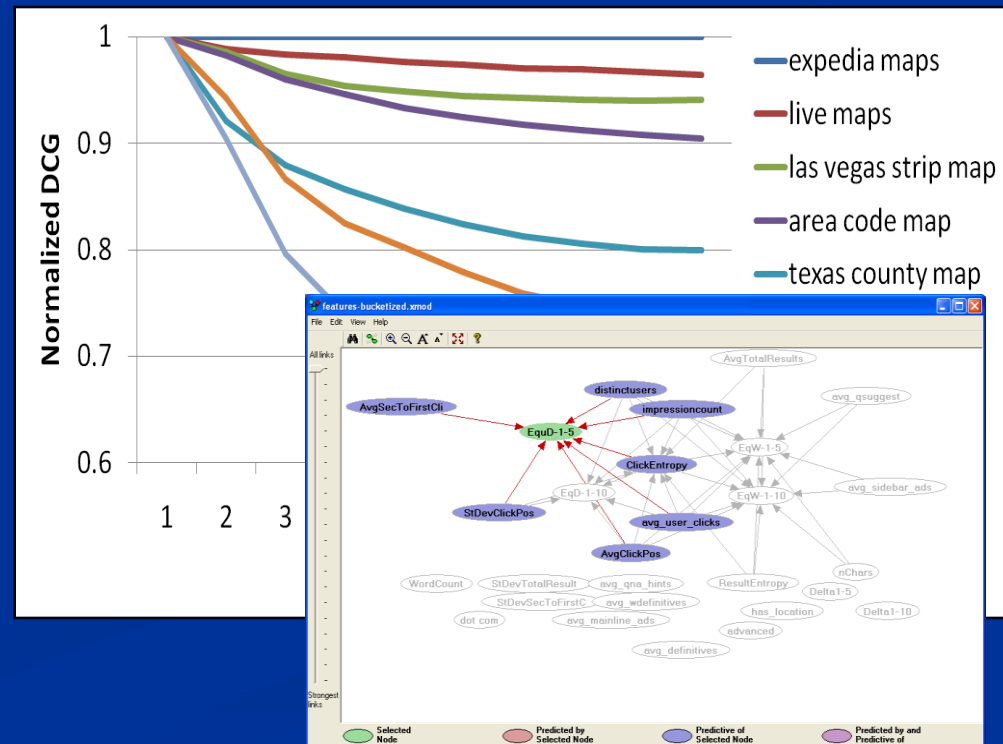

■ Pers_Behavior Match: visited URLs

■ Web Match: web rank

When to Personalize?

- Personalization works well for some queries, ... but not for others
- Framework for understanding when to personalize
 - Personal ranking
 - **Personal relevance** (explicit or implicit)
 - Group ranking
 - Decreases as you add more people
 - Gap is “*potential for personalization (p4p)*”

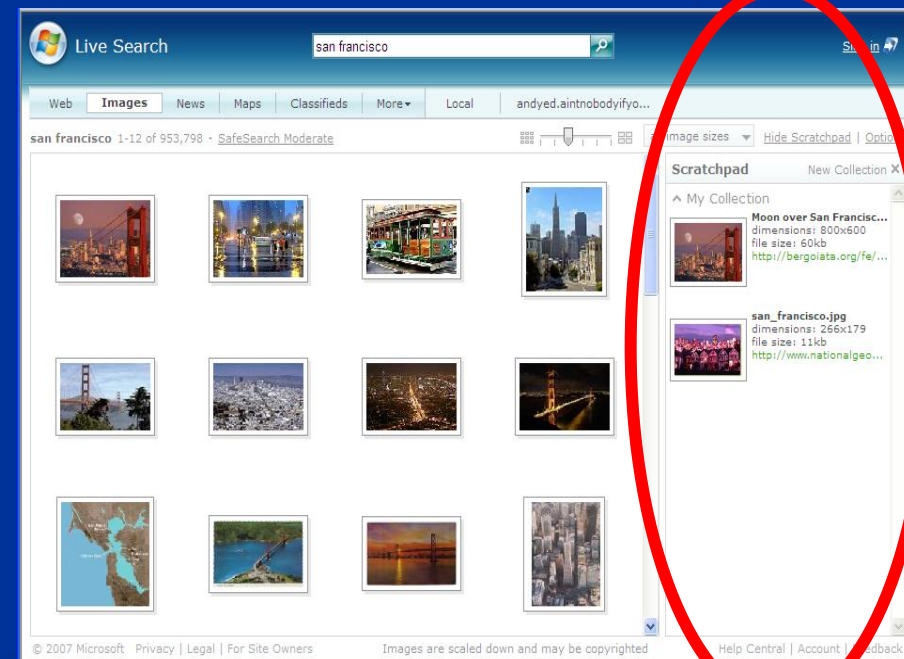

More Personalized Search

- PSearch - rich long-term context; single individual
- Short-term session/task context
 - Session analysis
 - Query: *ACL*, ambiguous in isolation
 - Natural language ... summarization ... ACL
 - Knee surgery ... orthopedic surgeon ... ACL
- Groups of similar people
 - Groups: Location, demographics, interests, behavior, etc.
 - Mei & Church (2008)
 - $H(\text{URL}) = 22.4$
 - Search: $H(\text{URL}|\text{Q}) = 2.8$
 - Personalization: $H(\text{URL}|\text{Q}, \text{IP}) = 1.2$
 - Many models ... smooth individual, group, global models

Beyond Search - Gathering Info

- Support for more than retrieving documents
 - Retrieve -> Analyze -> Use
- Lightweight scratchpad or workspace support
 - Iterative and evolving nature of search
 - Resuming at a later time or on other device
 - Sharing with others

ScratchPad

Beyond Search - Sharing & Collaborating

■ SearchTogether

- Collaborative web search prototype
- Sync. or async. sharing w/ others or self

■ Collaborative search tasks

- E.g., Planning travel, purchases, even understanding medical info; research joint project or report

- Today little support

- Email links, instant messaging, phone

- SearchTogether adds support for

- Awareness (history, metadata)
- Coordination (IM, recommend, split)
- Persistence (history, summaries)

Figure 1. The SearchTogether client. (a) integrating messaging, (b) query awareness, (c) current results, (d) recommendation queue, (e)(f)(g) search buttons, (h) page-specific metadata, (i) toolbar, (j) browser

Looking Ahead ...

- Continued advances in scale of systems, diversity of resources, ranking, etc.
- Tremendous new opportunities to support searchers by
 - Understanding user intent
 - Modeling user interests and activities over time
 - Representing non-content attributes and relations
 - Supporting the search process
 - Developing interaction and presentation techniques that allow people to better express their information needs
 - Supporting understanding, using, sharing results
 - Considering search as part of richer landscape

Using Context to Support Searchers
