Prototype-to-product challenges

devices-lab.org

- Hardware is hard... But prototyping is getting easier
- Transitioning a prototype to a robust, replicable form creates numerous barriers for users:
 - Often requires a complete redesign for robust product
 - Sourcing of components, enclosures, packaging
 - Creation of testing infrastructure
 - Potential for niche and low-volume products is never realized

Challenges of scaling

Accessibility

- Accessibility challenges are often extremely unique
- Tech solutions are therefore often highly tailored, involve the use of occupational therapists
- Process often highly expensive, limited to areas/people with access
- A large number of those with accessibility needs not adequately served by widely available tech

MakeAccessible Hackathon

devices-lab.org

“[I want] a magic button” that would allow “ten magic PCBs [to be] delivered with an enclosure that fits.”

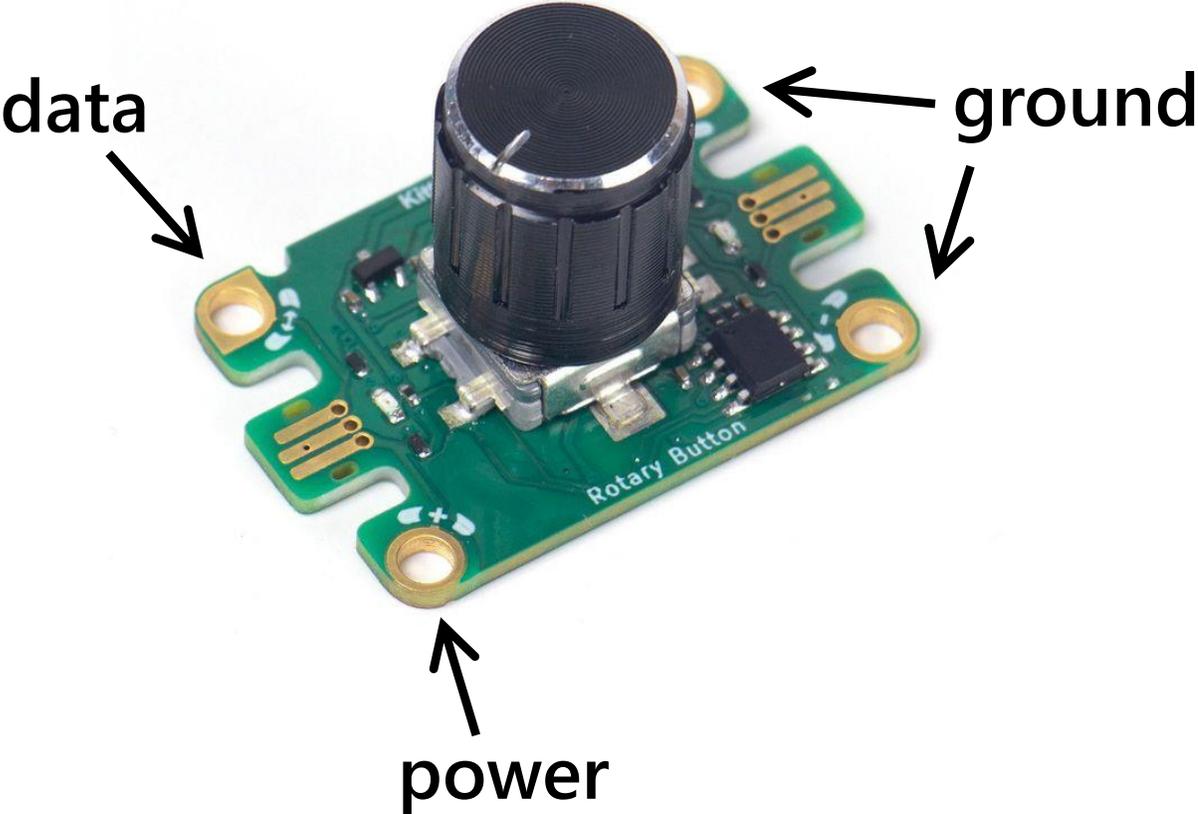

Motivation

Jacdac/micro:bit are great tools for creating plug-and-play desktop prototypes

But to create robust devices in higher volumes:

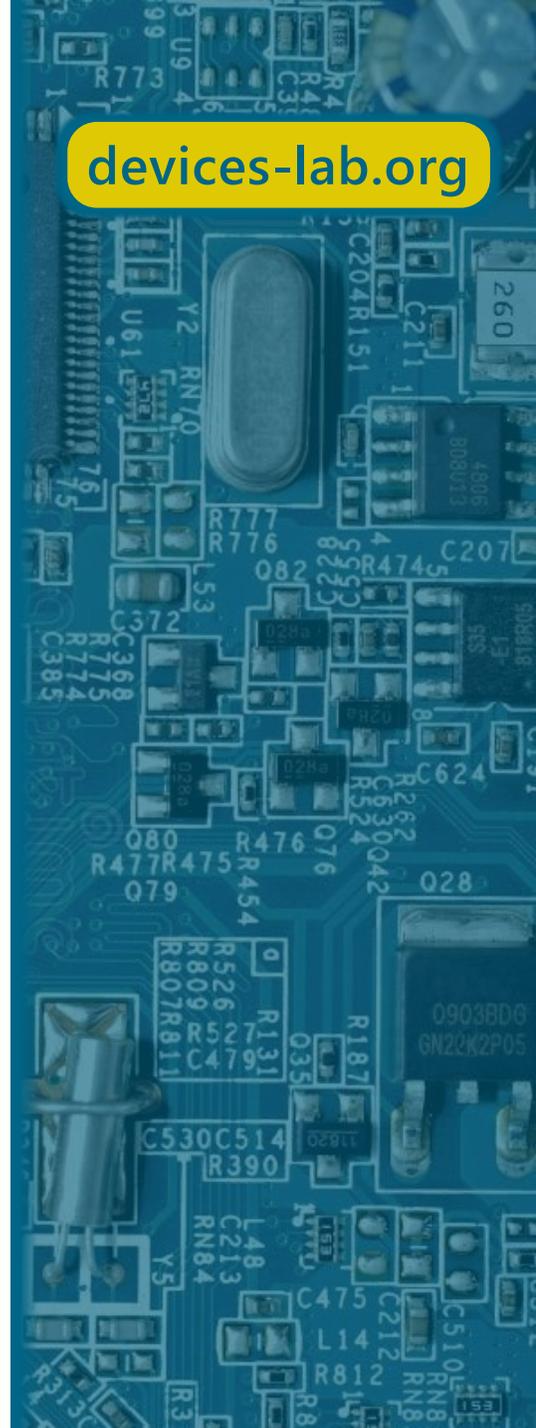

- Re-design of device using ECAD software (e.g. Altium, Kicad)
- Enclosure design and fabrication
- Too complex, too time consuming
- How can we empower those who are less experienced?

Kittenbot ^

- Microbit Adapter
- Microbit Adapter with MB
- Rotary
- Slider
- RGB LED Ring
- Key Switch
- Light Sensor
- Magnet Sensor
- Ultrasonic Sensor

Name: Rotary Button

Position: x:-15.00, y:-5.00, z:8.00

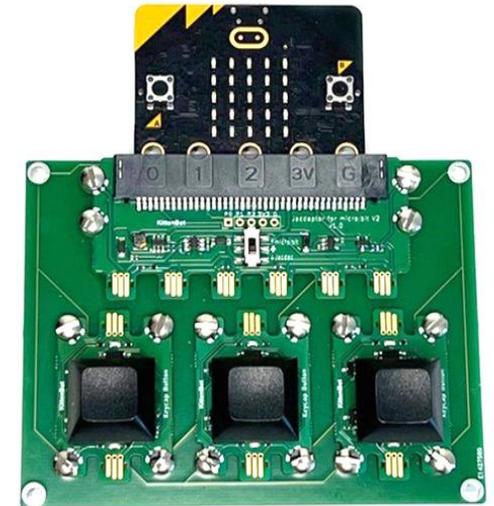

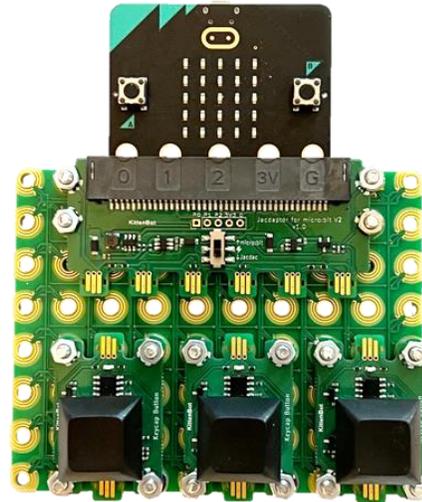

Height Offset: 0mm + -

Rotation: x:0, y:0, z:-90

Flattening

- **Incremental flattening** supports multiple designs of a device as it evolves from a prototype to product...

Opportunities for MakeDevice

devices-lab.org

- Education – D&T, undergraduate studies, developing projects
- Applications in Maker/Craft practices
- Deployment at scale, in-the-wild
- Further flattening of existing Jacdac modules and Jacdac designs
